38-year-old female patient

↓

Mild pain on biting related to tooth #26

↓

The tooth was tender to percussion and palpation with no mobility, swelling or sinus tract

↓

Radiographic examination revealed inadequate previous root canal filling with a missed MB canal

↓

Non-surgical endodontic retreatment

↓

CBCT examination: a separated instrument and a strip perforation were detected at the middle third of the MB canal

↓

Separated instrument bypass, mechanical preparation and master cone verification

↓

Obturation and lateral perforation repair

↓

3 months follow up (the patient was asymptomatic with radiographic evidence of bone healing)

↓

Self-funding

↓

No conflict of interest
